

Home Inventory System

These diagrams will employ the following conventions:

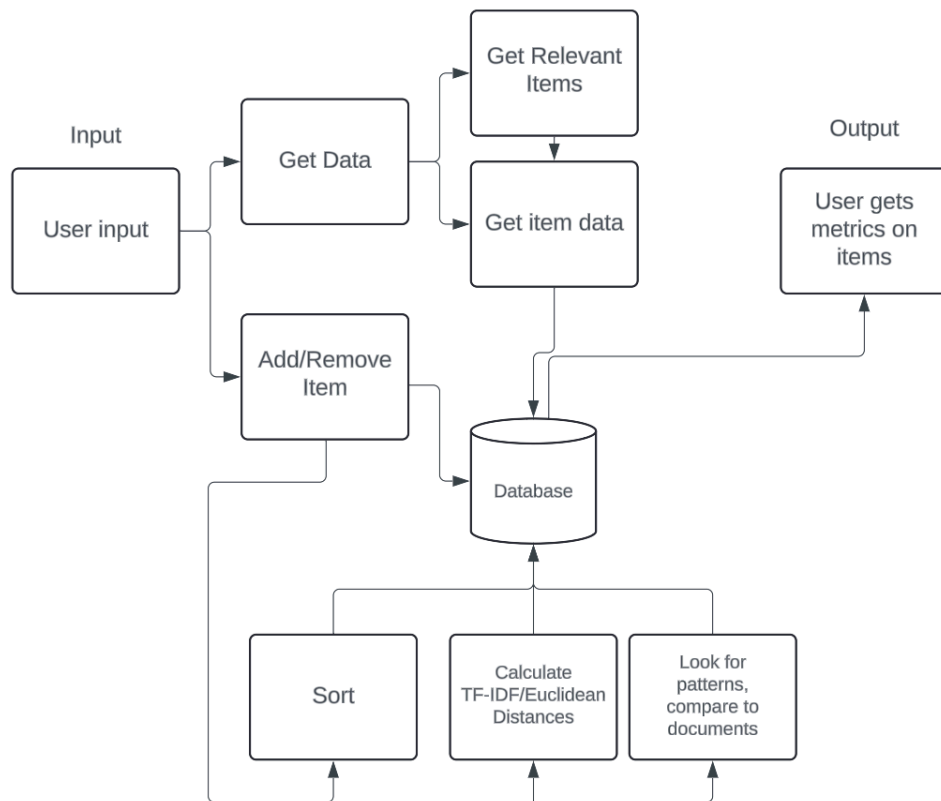

- Boxes represent a user or action
- Cylinders represent the application or database
- Arrows indicate a flow in usage or function.

At its core, our app should be able to let a user input data into it, catalog them into the inventory(ies), and allow the user to view the data sorted and cleaned up.

In a more technical sense, the user interacts with a database, whether by editing or viewing it, through a visually appealing interface.

To expand on interacting with the database, the “Get Data” and “Add/Remove Item” actions would have more handler functions that would process the data before sent to or read from the database.
